

# Two-Minute Accept / Reject Decision Flow

**Purpose:** Decide fast without guessing.

## Step 1 – Navigate Yourself

- Open the official site or verified profile manually (type it yourself or use a saved bookmark)
- Do not use the link you were sent

**If you can't find it there → Reject**

## Step 2 – Check the Link

- Expand shortlinks (see the full destination URL)
- Read domain left to right (character by character)
- Match exactly to official domain

**Mismatch → Reject**

## Step 3 – Source the Contract

- Fetch only from official docs or site (project's own website or docs page)
- Never from chat, comments, or DMs

**No official source → Reject**

## Step 4 - On-Chain Reality Check

- Code verified? (contract source is published)
- Proxy? (logic can be upgraded later)
- Creation date reasonable? (not brand new for a major launch)
- Activity rhythm sane? (not mass approvals and drains)

**Weird patterns → Reject**

## Step 5 - Wallet Discipline

- Switch to clean wallet (fresh wallet with nothing to lose)
- Near-zero balance
- Prefer limited approval (cap the amount)
- Plan revoke before approving (remove permission after)

## Final Gate

- Can you explain the signature in one sentence? (what the wallet popup will do)
- Confidence  $\geq 80\%$ ?

**If not → Reject**

**Safe accept beats lucky guess.**
